

SaberGate HL7 Message System is the HL7 data management solution that manages and enhances message streams between your information systems. SaberGate can merge or duplicate message streams on the fly and deliver the data to a downstream HL7 system or directly to a SQL database for reporting or other DB enabled applications. Scalable from an individual provider practice up to an Enterprise solution for a metropolitan, multi-campus hospital network, SaberGate can facilitate your communications requirements.

Key Features:

- SaberGate incorporates a data processing engine using simple rules to adjust data on the fly. From simple changes like the format of a room and bed location to redacting data for HIPAA compliance, the built in Rule Engine adapts the message stream to your needs.
- SaberGate can access SQL tables such as your Master Patient Index or remote EMR systems using the SQL lookup feature, enhancing the message content based on analyst provided criteria.
- SaberGate SQL Injector can dynamically build a reportable Data Repository that can be used by other applications, such as Uptime or your in-house business logic applications.
- Content Based Routing, merging and splitting of data streams are all easy tasks. Leverage one stream from your EHR to numerous downstream consumers.
- SaberGate HL7 is monitored using the same tools your IT team already uses in managing your Exchange and SQL servers.

SaberGate HL7 Nexus
 Enterprise Edition v2.1.5
